                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is an analogue of mature hCC beta subunit having residues 42, 47, 51, 89, 91, 92 and 99 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in mail and female and mails. See ARRISOG1. RISI325 and ARRISIG1-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ä
                                                                The sequence is an analogue of mature hCG beta subunit having residues 47.50 deleted and residue 51 changed from alanine to proline. When combined with the alpha subunit this construct has been shown to bind LH receptors and stimulate hos for induced cyclic ANP accumulation at ca. 50% the efficacy of hCG. This reduces the sterologemic potency of the analogue. It may be useful as an agonist for supression of gonadal activity during chamcherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21 SKEPLRPRCRPIXATLAVEKEGCPVCITVXTICAGYCPIWIRVLGGVLRALPQVVCNYR 80

                                                                                                                                                                                                                                                                    The sequence is an analogue of mature hcG beta subunit having to residues 134-145 deleted. It was pred. using PCR matagenesis to residues 134 cop codon into the gene. It may be useful as an agonist for supression of gonada
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                    New glyco-protein hormoine analogues - for inducing fertility a immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the sequence is an analogue of mature hCG beta subunit having residues 74, 75, 77, 90 and 31 replaced by the corresponding residues in the hTSH 79 protein. The chimeric hormone may be useful as TSH anasonist for the treatment of hyperthycoldism. See AMISO(41, AMISO(61-R1512) and AMISIG1-R15198.

                                                                                                                                                                                                                                                                                                  The sequence is an analogue of mature hCG beta subunit having residues 40, 42, 46-48, 51, 52, and 55 replaced by the corresponding residues in the bovine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, see AAR15043, AAR15061-R15125 and AAR15161-R15198.
                              The sequence is an analogue of mature hCG beta subunit having residues 2, 8, 10, 15, 42, 7 and 51 replaced by the corresponding residues in the human LH protein. The chimerte hormone may be useful in the treatment of infertility in men and women and the promotion of fartility in male and female animals. See AMRISO4, ARRISO61-RISI25 and AMRISO61-RISI28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glyco-protein hormone analogues - for inducing fertility a immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                         Ouery Match

The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, see AAR15043, AAR15061-R15125 and AAR15161-R15198.

of a contragestative medicament. The modified beta-hCC has reduced cross-reactivity with luteniasing homone (LM), as defined by the ability of both proteins to react with the same antibody. The modified beta-hCC can be used as a contraceptive in females, in a vaccine, in a hCC specific immunosasy and for applications where hCC is active, e.g. Kaposi sarcoma inhibition. The modified beta-hCC can produce neutralising antibodies to beta-hCG, which do not cross-react with other natural hormones.

N.B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40 (1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hCG beta subunit having residues 1-7 deleted. It may be useful as an agonist for supression of gonada activity during chemotherapy. See AARIS043, AARIS061-R1S125 and AARIS0418198.

If was prepd. using PGR mutagenesis to lineart a stop codon into the gene. It may be useful as an agouist for supression of gondali activity during remembeherapy. See AARI3043. ARRIS01-RIS125 and AARIS161-RIS199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glyco-protein hormone analogues - for inducing fertility (
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a human chorionic ganadotrophin (hCG) beta subunit mattern. The invention relates to amethod of forming a cysteine thou protein (1) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termin of both subunits or the dimerisation domain (DD) to either the N-termin of both subunits or the dimerising the products to form a heterodimeric protein analog (III). The method is used to produce analogues (goolists or analoguists) of deglycosylated glycoprotein hormongs, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease of associated with excessive levels of luteinising hormone). Products that retain DD's are also useful as immunogens or antiques (since a DD may containing highly antiquent class the formation of heterodimers, that have similar structures (and thus receptor-binding and immunogenic properties) to native dimers, and allows the combination of subunits that the production produced produc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; mutein; Beta subunit; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins

The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, 55, 56, and 88 replaced by the corresponding residues in the hFSH protein. It was prepd. by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The chimerit bormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR1S04). AAR15061-R15135 and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hos beta subunit having residues 105-107, 10 and 113 replaced by the corresponding residues in the bowine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, see AAR15043, AAR15061-R15125 and AAR15161-R15198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ouery Match 93.44; Score 726; DB 12; Length 145; Best Local Similarity 96.44; Pred.                                                                                                                                                                                       The sequence is an analogue of mature hcG beta subunit having residues 42, 47, 51, 77, 83, 89, 91, 92 and 99 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals. See AAR1904, AAR15061-RI3125 and AAR15161-RI3198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New glyco-protein hormone analogues for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                New glyco-protein hormone analogues - for inducing fertility a

It was prepd. by site directed mutagenesis of a CDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women AAR15041, AAR15061-R1515 and AAR15041, AAR15061-R1515 and AAR15041.

The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals. See ARISO43, ARRISO61-RISI23 and ARRISO61-RISI33 and ARRISO61-RISI39.

residues in the hESH protein. It was prepd by site directed mutagenesis of a robb sequence encoding the hCG bets subunit. On the Chimaric formone is capable of directing hormone binding to both this and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New glyco-protein hormone analogues - for inducing fertility as immuno-casteration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is an analogue of mature hCG beta subunit having residues 89, 91, 92, and 95-99 replaced by the corresponding residues in the hTSH protein and residue 94 deleted. The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism. See AMRISO43, AMRISO43, AMRISO41-RISI23 and AARIS161-RIS198.

This sequence is a fusion protein of HLM/HCG and Jun. The invention relates to a method of forming a cysteline knot protein (1) having alpha and beta-subunits comprising a traching a dimerisation domain (DD) to either the N-termin of both subunits or the N-terminus of the cather subunit and to the products to form a heterodimeric protein analog (II). The method is used to produce analogues (aspoils so re nategonists) of deglycosylated cused to produce analogues (aspoils so rantegonists) of deglycosylated the products to form a heterodimeric protein analog (II). The method is used to produce analogues (aspoils so rantegonists) of deglycosylated (the caused by polycystic ovarian disasse (associated with excessive cused to polycystic ovarian disasse (associated with excessive cather and and the analogue of a thicking to the deterodimers, that have shall ar structures and thus receptor-binding and immunogenic properties) to native dimess, and thus receptor-binding and immunogenic properties to native dimess, and thus receptor-binding and subunites that would other-vise combiner of poorly, or not at all. The N-terminal part of a glycoprotein hormone may formation of homodimers. Here and a disconment of the bording and individual subunits:

Contraction of homodimers. Hererodimers have lead the protect in times in the volume of a catherity, and attachment of the protect in times in the volume of the produces of a catherity and attachment of the produces of catherity and attachment of the produces in times in the volume of the produces of the produ
                                                                                                                                                                     Cystaine knot protein; protein formation; heterodimenic protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61

The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism.
                                                                                                                                                                                                                                                                                                                         New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is an analogue comprising amino acids 7-145 of mature hGG beta subunit having residues 7, 8, 10, 11, 12, 14, 16, and 18 replaced by the corresponding residues in the hFSH procein. It was prepd by site directed mutagenesis of a cDNA sequence encoding the hGG beta subunit. The chimmert horamone is capable of directing horamone binding to both LM and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15043, AAR15062-R15125 and AAR15161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, and 45-53 replaced by the corresponding residues in the hFSH protein. The chimeric hormone is capable of directing hormone blading to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animais. (See AAR15043, AAR15061-RIS125 and AAR15061-RIS125 and

The antigenic peptides of the invention are synthetic analogues of regions of this sequence. The peptides are preferably analogues of HCG modification of this sequence. The peptides are the antigenic modification of peptides. The peptides can then be coupled to carrier elicit anti-HCG antibodies (but at a lower level than the native peptide) and do not elicit antibodies (but at a lower level than the native peptide) and do not elicit antibodies to human luterinishing hormone. The conjugates can be used for vaccine development or to produce polytional antisera for danostic assays. Depending on the peptides used, the vaccines can be used to treat hormone and endocribe related tumours, cancers, hypertension (especially using anglotensin related peptides), and diabetes and associated vascular diseases, or as anti-pregnancy vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antigenic peptide; HCG; human chorionic gonadotropin; vascular disease; antigenic modification; immunogenic conjugate; vaccine development; anti-pregnancy vaccine; hormone related tumour; endocrine related tumour; cancer; hypertension; angiotensin; diabetes; therapy.

```
the invention relates to the production of analogues of a heterodimeric subunit glycoporotein hormone (GPR) e.g. human chorionic gonadotropin (CC (hCG), human lutefnising hormone (HFSH), human cluteinising hormone (hFSH), human cluteinisty and functional muterins, which are modified to contrain an intersubunit distiplied bond, between an alpha-subunit cystelia and iterasubunit cysteliae, for improved stability, the analogue retaining at least a portion of the injocativity for the corresponding native GPR receptor. This sequence to represents a chimaric horgyles are designed specifically to reduce perturbation of the Judoved analogues are designed specifically to reduce perturbation of the Judoved analogues are designed specifically to reduce perturbation of the Judoved analogues are designed specifically to reduce perturbation of the Judoved analogues are designed specifically corresponding greater likelihood that the dimer vill be formed in vivo and the formed dimer vill have affinity for the native receptors and have again the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                       Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotroph; human luteinfsing hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is an analogue of mature hCG beta subunit having residues 124'14' deleted. It was prepd. using PCR mutagenesis to insert a stop codon into the gene. It may be useful as an agonist ca supression of general activity during themotherapy. See ANRIOG18. ANRI

The invention relates to the production of analogues of a heterodimeric subunit giyopototein hormone (GPH) = 9. human choicionic gondoutcropin (CC), human lutefalial bromone (HPH), human interiorising hormone (HPH), human therefore the contain an intersubunit disulphide bod, hormone (HPH), human therefore the contain an intersubunit disulphide bod, between an alpha-subunit cysteine, which are modified to contain an intersubunit cysteine, for meterins, which are modified to contain an intersubunit cysteine, for the contain and a beta-subunit cysteine, for the contact proportion attive GH receptor. This sequence to represents a mutant chimaric hCG/hPSH-beta subunit used for generating the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer vill be formed in vivo and the formed dimer will have affinity for the native receptors and have sential activity on them The changes stabilise the GPHs and prolong the hormones. The analogues can have uses
                                   Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; hhuman chorionic gonadortopin; human lutelaitsing hormone; disulphide boi human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, 45-55, 55, 56, and 58 replaced by the corresponding residues in the hESB protein. It was prepd. by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone bluding to both LH and FSH receptors and may be useful for the treatment of infertility and FSH receptors and may be useful for the treatment of infertility and female animals. the invention relates to the production of analogues of a heterodimeric subunit giyosototein hormone (GFB) 4.9. Numan enforteint gonadotrophin (bCG), human lutefalsing hormone (HEB), human follicle stimulating hormone (HEB), human fulcing stimulating hormone (HEB), and functional cantens, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine bond, contains a limproved stability, the analogue retaining at least a portion of the improved stability, the analogue retaining at least a portion of the coloractivity for the corresponding native GFH receptor. This sequence crepresents a mutant chimeric hock/heBi-beta subunit used for generating to reduce perturbation of tha 3-dimensional structure of the hormone, to reduce perturbation of tha 3-dimensional structure of the hormone, condition and the formed dimen will have affinity for the native receptors and have against a cativity on them. The changes stabilise the GPHs and prolong as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hCG beta subunit having residues 19-55 deleted. It was prepd. using PCR mutagenesis to insert a stop codon into the gene. It may be useful as an agonist for supression of gonadal activity during chemotherapy. The invention relates to the production of analogues of a heterodimeric subunit giycoporotein hormone (GFH) a.9. human chorionic gonadotropin (hCG), human intensialing hormone (HCH), human fullicle stimulating hormone (HCH), human intensialing hormone (HCH), human fullicle stimulating hormone (HCH), human intensialing hormone (HCH), and intensional materials, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine, for the containing at least a portion of the binactivity for the corresponding native GPH receptor. This sequence to represents a mutated hGG-beta subunit trained spread analogues are designed specifically to modified GPHs. The improved analogues are designed specifically to the corpus and the formed analogues are designed specifically to the corpus greater likelihood that the diene vill be formed in vivo and the formed diene vill have affinity for the native receptors and have agond the biological activities of the hormones. The analogues can have uses a for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        81 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 140

The sequence represents the amino acid sequence of single chain goods.

The sequence represents the amino acid sequence of single chain goodscropin analogue 12. The giveoprotein homeone analogue 18.

Goodscropin analogue 19. The giveoprotein homeone and country is a substitute for the heterodinaric forms of the homeone, computed, as a substitute for the heterodinaric forms of the homeone. The single chain protein is further useful as a reagent in a commone. The single chain protein is further useful as a reagent in a more similar to the heterodinary as a disponsite tool to detect the commone. The single chain protein is further useful as a reagent in a common and the presence of antibodies with respect to the native proteins in the biological samples, as a control reagent in assay kits for assessing the presence of antibodies with respect to the native proteins in the puritying receptors to which the native homeones bind. The single chain forms of the heterodimers have the following advantages over their dimeric forms: they are more stable, problems of recombinant protein are reduced since only a single enter is needed to transcribe, curtainste and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying truncated forms with the activity of the dimer. The linkage between the subunits permits the protein to be engineered without disturbing the overall folding of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; single chain gonadotropin analog no:2; anti-infertility; drug; peptide therapy; luteiniaing hormone; LH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; Infertility; fusion protein.
                                                                                                                       New single chain forms of the glycoprotein hormone quartet useful for generating antihodies specifically immunoreactive with the new compounds in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5
                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hCG beta subunit having residues 39, 41-43, 45-55, 55, 56, 58, and 49-97 replaced by the corresponding residues in the hESH protein. It was pread, by site directed mutagenesis of a cOMA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both lift and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AARISO41-R15125 and AARIS161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      60 YRDVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDS 119

It was preped, using PCR matagenesis to residues a procedon into the gene. It may be useful as an agonist for supression of gonadal setUvity during chemotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New glyco-protein hormone analogues - for inducing fertility .
Immuno-castration agents, for uppressing reproductive system
development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glycoprotein hormone; immuno-castration; immuno-contragestive; vaccine; human chorionic gonadotropin;

```
This sequence is a fusion protein of hcc/HESH and Jun. The Invention relates to a method of forming a cystelia knot brotein (i) having a alpha can beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termina of both subunits or the N-termina of the other subunit and to the C-termina of the beta-subunit and dimerising to the products to form a hererodimeric protein analog (II). The method is the products to form a hererodimeric protein analog (II). The method is used to produce analogues (sgonists or antagonists) of deglycosylated glycoprotein hormones, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive lavels of lutelnising hormone). Products that retain DD is are also useful as immunogens or antigens (since a DD may contraining highly antigenic cannon acid sequences). Attachment of a DD (Which may be removed later) facilitates the formation of heterodimers, that have similar structures and allows the combination of subunits that vancid otherwise combines.

Contain allows the combination of subunits that vancid otherwise combines.

Containing the definition of subunits that vancid otherwise combines.

Containing the value of subunits and attachment of the DD reduces (formation of homodimers have longer circulation times in
                                                                                                  Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPRDHPLTCDDPRRQDSSS 121

NAME OF THE PROPERTY OF THE PR

```
Analogue 2 (human CG-beta(1-114)-linker-human CG-alpha(1-92)) is especific example of a single chain goadoctropin having a chorioni gonadotropin (CG) beta-subunit at the V-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 anino acida. The analogue has lutelnising hormone (lutropin) activity and is useful for inducing ovulation and increasing male fertility.
                                                                                                                                                Single chain gonadotropin; human chorionic gonadotropin; hCG; alpha; beta; subunit; analogue; glycoprotein hormone; fertility; inhabit; stimulate; increase; lutropin; luteinising hormone; LH; folilcle stimulating hormone; FSH; vaccine; contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Methods for altering fertility in mammals, esp. humans - e.g. stranuating fertility by reducing the activity and/or levels of stroutating glyco:protein hormones having lutropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       82.2%; Score 639; DB 16; Length 234; 94.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a fusion protein of HCC/HTSH and Jun. The invention calcidates to a method of forming a cystein knot protein (1) having alpha can beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termino of the catternial of both subunits or the N-termino of the cather the N-termino of the beta-subunit and to have so the comprision of the cather of the C-terminus of the beta-subunit and dimerising the products to form a heterodimeric protein analog (II). The method is compressed to produce analogues (sponiats of antagoniss) of deglycosylated glycoprotein hormance, potentially useful. e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive cathers of internialing hormone). Products that retain DD's are also useful as amminogened or antigens (since a DD may containing highly antigenic cannon acid asquences). Attachment of a DD (which may be removed later). Another combination of heterodimers, that have similar structures and allows the combination of subunits that would otherwise combines, and allows the combination of subunits that would otherwise combines. On the condition of subunits that would otherwise combines. CC condition of homodimers. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                   Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -

The invention relates to human single chain forms of the glycoprotein chromone quarter. Which is an agonist or antagonist of lutefabilisting hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (FSH), thyroid stimulating hormone (FSH), thyroid stimulating hormone (FSH), threse hormones are heteroflamers having identical alpha subunits and differing bets subunits. The agonist favors of single chain hormones are used in treating infertility, as aids in vitro fertilisation techniques, and other therapeutic methods as sociated with the native hormones. The single chain hormones are used in associated with the native hormones. The single chain hormones are used in detect the presence of antibodies with respect to the native proteins in biological samples, as control respect to the native proteins in biological samples, as control respects in assay kits for assessing the levels of these hormones in various samples, in detecting and purifying

It was prepd. by site directed mutagenesis of a DNA sequence encoding the hCG beta subunit. The chimeric hornome is capable of directing hornome blunding to both id and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15043, AAR15061-R15125 and AAR15161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTNTRVLGGVLPALPQVVCNYR 61

The sequence represents the amino acid sequence of human chorionic conadortropin (160) beta, amino acids 111. The protein is an important glycoprotein hormone heterodimer, along with luteinising hormone (EM), follicle stimulating branches is along with luteinising hormone (EM), follicle stimulating branches global subunits. The proteins are useful for generating antibodies specifically humane (EM), which all have lefentical alpha subunits but differing beta subunits. The proteins are useful for generating antibodies specifically forms of the hormones, in the treatment of infertility, as identification techniques, and in other therapeutic methods associated with he native hormones. The single chain proteins are folling the presence of antibodies with respect to the native proteins in the blobgical samples, as control reagents in assay kits for assessing the levels of these hormones in various samples, and in detecting and purifying receptors to which the native hormones build the single chain forms of the heterodimers are made of the single chain forms of the heterodimers and of consideration of collowing advantages over their dimeric forms they are more stable, consoliant production are reduced since only a single gene is needed to transcribe, translate and process, provide an alternate form thus permittes fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying the subunits permits the protein. One engineered without disturbing the coverall foliang of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; single chain gonadotropin analog; anti-infertility; drug; peptide therapy; intentainsing hormone; IH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoproten; infertility; fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human chorionic gonadotropin beta-subunit fragment (1-114 amino acids).
                                              New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPR 115

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          QQ
creeptors to which the native hormones bind. The single chain hormones are also used in affinity chromatographic preparation of receptors or authormone antibodies. They are used as purification tools for all antibodies. They are used as purification tools for all all and to monitor to shadton of subsequent preparations of these antertals and to monitor of stoopcreates are used to generate antibodies specifically immunoreactive start these new compounds, as substitutes for the heterodiaeric forms of hormones. The present sequence is human single chain gonadotroph and on the present sequence is human single chain gonadotroph appretain consisting of human choicing demonstrating compounds, as a substitutes for the heterodiaeric forms of consisting of human single chain gonadotroph alpha-submit (1-114 anino acids) fused to human single chain gonadotroph alpha-submit astacting compound for templete directed vaccines for use in humans. Concept development of hormone-specific vaccines for use in humans. Conceptor hormone-specific vaccines for use in humans. Conceptor the present sequence is not shown in the specification, but is as SEQ ID NO: 6, in figure 6 of the specification (AAEO4475).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; chorionic gonadotropin; hCG; glycoprotein hormone; infertility; lucenising hormone; HH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TH.

This sequence is a fusion protein of hcc/HTSH and Jun. The invention relates to a method of forming a cysteine knote protein (1) hating alpha clears to a method of forming a cysteine knote protein (1) hating alpha and beta-subunits comprising attaching a dimerisation domain (0D) to either the N-termina of both subunits or the N-termina of the channel of the beta-subunit and dimerising the products to form a heterodiment protein analog (11). The method is the products to form a heterodiment protein analog (11). The method is the dipolar products analogo (11). The method is dipolar by products (10) and products that reading inferrility of where caused by polycystic ovarian disease (associated with accessive levels of intelliating hormone). Products that readin DP's are also useful can immunogens or antigens (since a DD within may be removed later) canino acid sequences). Attendent of a DD (within may be removed later) canino acid sequences). Attendent of a DD (within may be removed later) can include thus receptor-binding and immunogenic properties) to native dimers, or and allows the combination of subunits that would otherwise combine portion and induction of subunits that would otherwise combine producting and induction of a disconding part of a glycoprotein hormone may contained to the production of subunits have longer circulation times in
                                                                                                                                                                                                                                                                                                                                                                                                                                Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cysteine knot protein; protein formation; heterodimeric protein analog;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ογ
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human single chain forms of the glycoprotein charmone quartet which is an agonist or antagonist of intelainising hormone conformed quartet which is an agonist or antagonist of intelainising hormone (TH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), thyroid stimulating hormone (TSH), thyroid stimulating hormone (TSH) and the same are heterodimers having identical alpha subunits and differing beta subunits are head of single chain hormones are used in treating infertulity, as olds in vitro fertulisation techniques, and other therapeutic methods associated with the native hormones are useful as reagents in a manner similar to heterodimers, as diagnostic cold to control reagents in assay kits for assessing the saredgents in amanner similar to heterodimers, and diagnostic tools to control reagents in assay kits for assessing the lovels of them hormones are also used in affiliar, chromatographic preparation of receptors or attibutions and in affiliar, chromatographic preparation of receptors or antibution of subsequent preparations of these materials and common or isolation of subsequent preparations of these materials and common of subsequence administered as a trugs. The single chain of subsequence is human chorionic gonadotropin beta with the present sequence is human chorionic gonadotropin beta constructing single chain gonadotropin manalogs related to the invention. Analog single chain gonadotropin manalogs related to the invention. Analog vectine design and for the development of hormone-specific vaccines for the unamplate directed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cysteine knot protein; protein formation; heterodimeric protein analog; deglycostylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

This sequence is a fusion protein of HCG/HTSH and Jun. The invention relates to a method of forming a cystein knot protein (i) having alpha and beta-subunits comprising attaching a dimerisation domain (UD) to either the N-terminal of both subunits or the N-terminal of the Deta-subunit and the subunit and to the C-terminus of the beta-subunit and dimerising the products to form a heterodimeric protein and lamerising to produce analogues (asponists or a stage). The method is used to produce analogues (asponists or antagonists) of deglycosylated glycoprotein hormones, potentially useful, e.g. for treating infertility where caused by polygystic ovarian disease (associated with excessive the satisful profuncially useful, e.g. for treating infertility as immunogens or antigens (since a Do may containing highly antigenic anino acid sequences). Attachment of a DD quintaining highly antigenic and indivast her formation of sherocidimers, that have similar structures and allows the combination of subunits; that would otherwise combines of subunits that would otherwise compline and and and attachment of a dyopoprotein hormone may be modified without loss of activity, and attachment of the DD reduces by conty, or not at all: The N-terminal part of a glycoprotein hormone may be modified without loss of activity, and attachment of the DD reduces by vivo than individual subunits.
                                                               Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic overlan disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2 SKEPLAPRCRPINATLAVEKEGCPVCITVATTICAGYCPPATRULGOVLAALOOVUCNYR 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is a fusion protein of hGC/HTSH and Jun. The Invention relates to a method of forming a cysteine knot protein (1) having alpha calculates to a method of forming a cysteine knot protein (1) having alpha can beta-subunits comprising attaching a dimerisation domain (Db) to either the Witermini of both subunits or the Witerminios of the catherine of the channel of both subunits or the Witerminios of the catherine of the caused to produce analogues (sqonies or antagoniss) of deglicosylated of there caused by polycystic ovarian disease (associated with excessive lawning to properties). Froducts that retain Do's are also useful as immunogens or antigens (since a Do may contraining highly antigenic cannon acid asquences). Attachment of a DD (Which may be removed later) facilitates the formation of heterodimers, that have similar structures and allows the combination of subunities that would otherwise combine of subunities that would otherwise.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 SKPPLRPRCRPINATLAVEKEGCPVCITVATTICAGYCPPATRVLGGVLPALPQVVCNYR 61

The single-chain gonadotropin analogue 2a (human CG-beta(1-114) [N13X, X13X], 110XF-thuan CG-alpha[1-29][N3X, X19X], 10XD be derived from analogue 2 by removing at least one of the four glycosylation sites. The partially deglycosylated analogue has anti-luteinising hormone (lutropin) activity and can be used for facilitating ownlation, terminating pregnancy and reducing androgen secretion. The effects of analogue 2a depend upon the time it is administered; will minite fertility when given early in the menstrual cycle but will inhibit fertility when given later.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Owery Match 80.4%; Score 625; DB 16; Length 234; Best Local Similarity 92.7%; Pred. This introduces an additional cleavage site for CMFs, useful for determining the distulphide bonds. This can be used to show that mutagenish has not altered the "normal" disulphide pattern of analogues, and for See AAR15041, AAR15061-R15125 and AAR15161-R15198.

Annam chorionic gonadotropin (button) that ground trefails and trefails and promone (HPH), human follicle stimulating hormone (HPH), human follicle stimulating hormone (HPH), and finctional mutefuls, which are modified to contain an intersubunit disalphide bond, between an alpha subunit cysteine and a beta subunit cysteine, for the corresponding native GH receptor. This sequence blocktivity for the corresponding native GH receptor. This sequence correctivity for the corresponding native GH receptor. This sequence of the hormone hornor and the subunit in which amino acid residues 55-103 of the hEHI-bet subunit replace anno acid residues of the hormone subunit and the sequence of the hormone of the subunit in which amino acid residues of the corresponding analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone of modified draw will have affinity for the native receptors and have appointed early early and propose the hormone and propose the hormone and a for the native GPHs and prolong the hormone as for the native GPHs and prolong the hormone as for the native GPHs and prolong the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The sequence is an analogue of mature byc beta subunit having residues 99, 113 and 115-172 replaced by the corresponding statement in the treations in the human if protein and residues 123-15 deleted. The chimeric hormone may be useful in the treatment of infertility fin end and women and the promotion of fertility in male and female
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPR 115

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                       The Invention relates to human single chain forms of the glycoprotein corresponding equartet which is an agenist or antegonist of intensiving hormone component quartet which is an agenist or antegonist of intensiving hormone (15), follicle stimulating hormone (15), forms of single chain hormones are used in trengentic methods in vitro fertilisation techniques, and other therapeutic methods in vitro fertilisation techniques, and other therapeutic methods of sasociated with the native hormones, are single chain hormones are saging as reagents in a manner similar to heterodiners, as diagnostic tools to detect the presence of antihodies with respect to the native proteins in biological samples, as control reagents in assay kits for assessing the biological samples, as control reagents in detecting and purifying receptors to which the native hormones alministration costs for an antihodies. They are used as purification costs for an antihodies. They are used as purification costs for an antihodies. They are used as purification costs for an antihodies. They are used as purification costs for a subsequent preparation of treeptors of subsequent preparations of these man compounds, as substitutes for the heterodimeric forms of hormones. The present sequence is human single chain gonadorizopin consisting of human chortonic gonadorizopin (G) beta subunit (1-11 annihom acids) by a linker sequence. This analog serves as a useful carbon consisting of human single chain gonadorizopin and for the development of hormone-specific vaccines for use in humans.

(1-2) aniho acids) by a linker sequence. This analog serves as a useful carbon the human single chain gonadorizopin analog no: 2 shown as the human single chain gonadorizopin analog no: 2 shown and a single chain gonadorizopin analog no: 2 shown and a single chain gonadorizopin analog no: 2 shown and a

                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is an analogue of mature hCG beta subunit having residues 112-145 deleted. It was prepd. using PCR mutagenesis to insert a stop codon into the gene. It may be useful as an agonist can supression of gondal activity during chemotherapy.
                                                                                                                    The sequence is an analogue of mature hCG beta subunit having residues 112, 113, and 115-114 replaced by the corresponding residues in the hTSR protein and residues 125-145 deleted. The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPR 115

The sequence is an analogue of mature hFSH beta subunit having several residues replaced by the corresponding residues in the hCG protein. The chimert bornone is capable of directing bornone blinding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AAR15041, AAR15061-R13125 and AAR15161-R13192)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hCG beta subunit having residues 105-107, 100, 113, 115-117, and 119-122 replaced by the residues 105-107, 100, 113, 115-117, and 119-122 replaced by the responding residues in the bowine LH protein and residues 123-142 deleted. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunosen, agoinst and/or antagonist. See AARISO41, ARRISO61-R15125 and AARISO61-R15139.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
    New glyco-protein hormone analogues - for inducing fertility a 
immuno-castration agants, for suppressing reproductive system 
development and as immuno-contragestive waccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ouery Match 77.21; Score 600; DB 12; Length 115; Best Local Similarity 98.24; Pred. Addition of oligosaccharides has a positive effect on stability of hormones in circulation and can be used to prevent unvanted antibody or receptor interactions. The present analogue has anti-intelnishing hormone (lutropin) activity and can be used for facilitating owniation, terminating pregnancy and reducing androgen secretion.

The sequence is an analogue of mature hCG beta subunit comprising residues 1-115 of hCG beta having residues 10-104, and 112-115 replaced by the corresponding residues in the hESH protein. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See AARISO43, AARISO61-R15125 and AARIS161-R15198).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Opery Match 75.4%; Score 586; DB 12; Length 115; Best Local SImilarity 96.4%; Pred. The invention relates to human single chain forms of the glycoprotein hormone quarter which is an agonist or antegonist of intentialing hormone (LH), follicle stimulating hormone (TSH), thyroid stimulating hormone (TSH) or chorionic gonadotropin (CG). All these hormones are heterodimers having identical alpha subunits and differing beta subunits. The agonist forms of single chain hormones are used in treating infertility, as aids in vitro fertilisation techniques, and other therapeutic methods associated with the native hormones. The single chain hormones are useful as reagents in a manner similar to heterodimers, as diagnostic tools to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents the amino acid sequence of single chain gondedtropin analogue 18. The giveprotein homomone and contained to the heterodiment of the homomone, the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeutic methods associated with the native hormone. The single chain protein is further useful as a reagent in a manner similar to the heterodimen, as a disquostic tool to detect the control of any presence of antibodies with respect to the native proteins in the bound of any presence of antibodies with respect to the native proteins in the control of any as a control reagent in assay fits for assessing the presence of antibodies with respect to the native proteins in the lowels of these hormones in various samples, and in detecting and protein of forms of the heterodimers have the following advantages over their dimeric forms: they are more stable, problems of recombinant production are reduced since only a single gene is needed to transcribe, ctuanslate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms care unique starting materials for identifying truncated forms with the catculty of the dimer. The linkaga between the subunits permits the protein to be engineered without disturbing the overall foliding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

The sequence is an analogue of mature hCG beta subunit comprising residues 11:15 of hCG beta having residues 105-107, 109, 110 and 112-115 replaced by the corresponding residues in the hFSH protein. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (see AARISO43, AARISO61-RIS125 and AARIS161-RIS198).
                                                                                                                                                                                                                                                                                                                                                             2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61

The single chain hormones cc antibormone antibodies. They are used superlication tools for isolation of subsequent preparations of these materials and to monitor continuous faingle chain hormones administered as drugs. The single chain of subsequent preparations of these materials and to monitor continuous. The present sequence is the man single chain gondoricative with these new compounds, as substitutes for the heterodiancic forms of proporteins are used to generate antibodies specifically immunorsactive with these new compounds, as substitutes for the heterodiancic forms of consisting ones related to the invention, analog no.8 related to the invention, analog no.8 is a fission protein catals, follicia simulating bormone (FSB) beta-subunit (1.90 maino acids) and DDPR peptide fused to human single chain gonadotropin alpha subilit (1.92 maino acids) by a linker sequence. This analog serves as a cuts) as definited the contained for template directed vaccine design and for the development of hormone-specific vaccines for use in humans.

The sequence is that of a modified form of human chorionic gonadotrophin (MCG), analogue "0", in which anno acids in the "D" and/or "G" regions have been subtituted resulting in changes in the binding specificity and avidity of luteinising hormone (HA) and follicle stimulating hormone (HA) and follicle stimulating beta-heterodimeric polypeptide having an affinity to vertebrate LH and FSH receptors. Such an analogue can be prepared having a desired ratio of FSH:LH activity. The polypeptide may be used for treating human infertility or polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New alpha, beta-hetero:dimeric polypeptide derivs. - which bind to truchising and follicle stimulating hormone receptors, useful for controlling the ratio of FSH to LH activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HCG; human; chorionic gonadotropin; beta-subunit; heterodimer; alpha-subunit; histeropin; state receptor; HS; HSH; thyrotropin; predion; or region; protein engineering; fertility; hormone; folicie stimulating hormone; luteinising hormone; rSH; ovulation; spermatogenesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                               Analogue 8 (hCG-beta(1-100)-hFSH-beta(95-103)-DDPR-linker-human alpha(1-92)) is a specific example of a single chain gondoctropin having a chorionic gondoctropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 anino acids. The analogue has follicle stimulating homone (follitropin) and lutefnising hormone (lutropin) and lutefnising hormone (lutropin) activity but is structurally more similar to hCC then to hFSH. The analogue is useful for inducing follicle development and increasing male fertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

The invention relates to human single chain forms of the glycoprotein channed quarter which is an agonist or antagonist of lutefinising hormone (CHJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (CHJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (CHJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH) are considered that the submits and differing beta submits. The agonist for having identical alpha submits and differing beta submits. The agonist considered with the native hormones are used in treating infertility, as alds as reagents in a manner similar to heteroidmers, as diagnostic methods as reagents in a manner similar to heteroidmers, as diagnostic tools to detect the pressure of antibodies with respect to the native proteins in biological samples, as control reagents in stars kind of these hormones in various samples, in detecting and purifying receptors to which the native hormones bind; the single chain hormones and third preparation of receptors or antibodies. They are used as purification tools for antibodies than hormones and ministered as drugs. The single chain hormones and submitistered as drugs. The single chain hormones are also used in grinity chromatographic preparations of these materials and to monitor levels of studies than hormones administered as drugs. The single chain normones and submitistered as drugs. The single chain of subsequent preparations of these materials and to monitor levels of human compounds, as substitutes for the heteroidneric forms of the hormones. The present sequence is human single chain gonadorropin and of seconds of the complex of hormones specific vaccines for use in humans.

C submit (1-92 amino acids) by a linker sequence. This analog serves as a useful starting compound to hormone-specific vaccines for use in humans.

C submit (1-92 amino acids) by a linker sequence this analog serves as a useful starting compound single to hormone specification (AREA0481).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence is an example of a glycoprotein hormone beta-chain

that analogue used to construct an alpha, beta wheterodimer polypeptide

with altered binding affinity to LH receptor and FSH receptor. The

theterodimer preferably contains an HGC alpha-submit and a chimaeric

beta-subunit contains HGC, LH, FSH and/or thypotropin residues.

Ending activity and specificity may be altered without disrupting

the terodimer formation or reaction with antibodies. The Dresgion of

HGC is most important for FSH subunit and the Greedinn is

the most important for FSH binding, and the Greegion of

and G of Ismostrat for FSH binding, Analogue-G, with an FSH preceptor

and G millial receptor. A cDMA for analogue-G may be expressed in a

C COS-7 cell culture. This type of hormone analogue may be useful

C diseas, or to induction of ovulation in women with polycystic ovary

some circulating like.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; single chain gonadotropin anglog no:8a; anti-infertility; drug; peptide therapy; lutefailsing hormone; Lif follicle stimulating hormone; PSB; thyroid stimulating hormone; TSB; chorionic gonadotropin; CG; dlycoprotein; infertility; fusion protein; mutant; mutein.

                                                                                                                                             Gaps
                                                                                                                                                                                              The sequence is an example of a glycoprotein hormone beta-chain analogoue used to construct an alpha, peta-hetrodimer polypeptide with altered binding affinity to LH receptor and FSH receptor. The heterodimer prefetchly contains an RG alpha subunit and a chimmeric beta-subunit containing HG, HH, FSH and/Or thyrotropin residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New alpha, beta-hetero:dimeric glyco:protein hormone polypeptide(s) - having a non-naturally occurring beta-subunit derived from hCG, LH, FSH and TSH
                                                                                                                                                                                                                                                                                                                                  ö

It is was used in the prepor of an alpha, beta-hetecodiment; polypeptide having an affility to vertebrate LH and FSH: He activity. The polypeptide may be used for treating human infertility or polycystic ovarian disease.

The single-chain gonadotropin analogue [8a (hCC-beta(1-100)[NIJX,N30X]-hFSH-beta(55-103)-DDPR-linker-chaman CC-alpha(1-2)(NISX,NDSX)] can be derived from analogue 8 by removing at least one of the glycosylation sites. The partially deglycosylated analogue has antifolicle stimulating hormone (follicle and and analogue has antihomnone (lutropin) activity and is useful for treating ovarian hyperstimulation and reducing spermatogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          "wild-type Asn at position 78 of the alphasubunit is pref. replaced by another amino acid (esp. Gin) to remove a glycosylation site.
          "wild-type Asm at position 52 of the alphasubult is pref. replaced by another amino acid (esp. Glm) to remove a glycosylation site"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single chain gonadotropin; human chorlonic gonadotropin; hCG; piphz, beta; subunit; analogue; glycoprotein hormone; fertility; inhibit; stimulate; increase; lutropin; luteinising hormone; LH; follicle stimulating hormone; FSH; vaccine; contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having intropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               71.9%; Score 559; DB 16; Length 234; 86.3%; Pred. Binding activity and specificity may be altered without disrupting heterodiar formation or reaction with antibodies. The b-region of hete cis most important for LH receptor binding, and the G-region is most important for LH receptor binding, and the G-region is most important for LH receptor binding, and the G-region and and EMB (-region, has high affinity to both LH and FSH receptors. A CNMA for analoque-CT (AMB8034) is digested with BglII and SSI and ligated with oiloque-CT (AMB8034) is digested with BglII expected to the complexity of the color of the col

The sequence represents the amino acid sequence of single chain good acid and acid open 18. The glycoptocein homomon and sogue 18. The glycoptocein homomon and sogue 18. The glycoptocein homomon acid open acid of a sequence of the homomon acid open 18. The sequence of the homomon acid open 18. The first the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeutic methods associated with the native homomon. The single chain protein is further useful as a reagent in a manner similar to the heterodimer, as a diagnostic tool to detect the presence of antibodies with respect to the native proteins in the bringles of antibodies with respect to the native proteins in the close of antibodies with respect to the native proteins in the puritying receptors to which the native homomons bind. The single chain of the presence of antibodies with the native homomons bind, the single chain forms of the heterodimers or homodimers have the following advantages over thair dimeric forms: they as single each is needed to transacribe, cranalate and process, provide an alternate form thus permitting fine tuning of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying truncated forms with the activity of the dimer. The linkage between the subunits permits the protein to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Owery Match 71.9%; Score 559; DB 22; Length 234; Best Local Similarity 81.5%; Pred. analog no:3 related to the invention. Analog no:3 is a fusion protein consisting of human lutelnishing hormone (EH) beta-subunit (1-114 maino acids) fused to human single chain gonadotropin alpha-subunit (1-92 maino acids) by a linker sequence. This analog serves as a useful starting compound for template directed vaccine design and for the development of hormone-specific vaccines for use in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVYCNTR 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is an analogue of mature hCG beta subunit having several residues replaced by the corresponding residues in the boyone LH protein and having residues 123-145 deleted. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New glyco-protein hormone analogues - for inducing fertility a 
immuno-castration agents, for suppressing reproductive system 
development and as immuno-contragestive vaccines.

                                                                                                                                                                                      ç
                                                                                                                                                                                                                                 a
                                                                                                                                                                                                                                                                                                                   윤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a fusion_protein of the human leutenising component (hill) beta subunits and Jun. The invention relates to a method of forming a cysteine knot protein (1) having alpha and method of forming a cysteine knot protein (1) having alpha and method of forming a cysteine knot protein (1) having alpha and method of forming a cysteine knot protein diemeistand dameising the alpha subunit and component of the alpha subunit and the relation of the alpha subunit and an anioques (4) the method is used to produce a heterodimeric protein analog (11). The method is used to produce analogues (agonists or antagonists) of deglycosylated glycoprotein or promose, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive levels of utenishing hormone). Products that retain DD's are also useful as immunogens or antigens (alone a DD may containing highly antigent camino acid sequences). Attachment of a DD (which may be removed later) call sequences, the combination of subunits that would otherwise combine companion of subunits that would otherwise combine and allows the combined on subunits that would otherwise combine component of the without loss of activity, and alterhand to the DD reduces to mander the companion of subunits have longer circulation times in
